                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a gene encoding scytalone dehydrogenase (SCDH), that functions in the presence of an inhibitor, comprising an optionally mutated, defined amino acid sequence given in the specification. Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors and evaluating sensitivity to them. The current sequence represents the Scytalone dehydrogenase gene sequence.
                                                                                                                                                                                           Scytalone
                                                                                                                                                                                                                                     Scytalone dehydrogenase gene #SEQ ID

Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors a evaluating sensitivity to them. The current sequence represents the

Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors and evaluating sensitivity to them. The current sequence represents the Scytalone dehydrogenase DNA sequence. Note: gene sequence from this is

                                                                                                                                                          The invention relates to a gene encoding scytalone dehydrogenase (SCDH), that functions in the presence of an inhibitor, comprising an optionally mutated, defined amino acid sequence given in the specification. Also disclosed is a method for evaluating rice blast fungus (Pyricularia oryzae) and Magnaporthe grisea sensitivity to scytalone dehydrogenase inhibitors. The gene is useful for screening for new SCDH inhibitors and evaluating sensitivity to them. The current sequence represents the Scytalone dehydrogenase DNA sequence. Note: gene sequence from this is given in ADC16592.
                                                                                                        Sequence 610 BP; 148 A; 179

```

The invention relates to the gene cluster encoding the polypeptides responsible for the biosynthesis of the polypene antibiotic amphotericin (amph) of Streptomyces nodosus. Polynucleotides of the invention are useful for preparing amphotericin derivatives or analogue antibiotic agents with altered properties and in the biosynthesis of polyketides other than amphotericin. amphDIII, amphDII or amphDII mutants are useful

isolate candidate molecules for rational drug discovery programs. antisense nucleic acids, useful for identifying proteins or screening homologous nucleic acids required for cellular proliferation to

Claim 14; SEQ ID NO 30151; 1766pp; English.

The invention relates to an isolated nucleic acid comprising any one of CC the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid comprising a promoter operably linked to the nucleic acid concoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated continued; (5) producing the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway of identifying a gene required for cellular proliferation or the test compound that inhibits gene product is or that has an activity against a biological pathway in which a proliferation, or that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the extent compound that inhibits proliferation of an organism. The antisense nucleic acids are useful for cellular proliferation to isolate candidate molecules for rational conformation or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, conformation of promat directly from MIPO at the target of a compound that inhibits the conformation of the target of the printed specification, but was obtained in cells of the sequence is one of the target conformation of the compound that the sequence is one of the target conformation. The present sequence data for this patent did contonic format directly from MIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                capable of altering the sensitivity of a microorganism to an antimicrobial agent by employing efflux pumps comprising polypeptides encoded by the following genes: PA1874, PA4142, PA2389, PA1876, PA4143, PA2390 or PA1163. The method is useful for identifying modulators of microbial resistance of an organism in a biofilm. The methods are also useful for identifying genes that encode proteins that play a role in biofilm resistance. The method is particularly useful for screening compounds or discovering compositions that will inhibit biofilm formation and overcome their resistance mechanisms. These methods are particularly useful in medical, industrial or natural settings, where formation of biofilms can have serious negative consequences and result in high costs both in human health and economic terms. The present sequence is a coding/control sequence shown in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               efflux pumps containing polypeptides,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This synthetic gene codes for a human Factor-VIII protein that lacks the central B domain (amino acids 760-1639) of the native protein. In the synthetic gene, non-preferred or less preferred codons of the native gene (see AAV23339) are replaced by codons favored by highly expressed human genes to provide high-level expression in mammalian cells. The synthetic gene was assembled from 29 pairs of oligonucleotides (see AAV2340-97) which served as PCR templates. Synthetic genes of the invention (see also AAV23289-91) are used for production of recombinant proteins in mammalian cells at levels of at least 500% of those obtained using the natural genes. They can also be used in gene therapy. An expression vector comprising a synthetic gene and a mammalian cell harboring a synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New synthetic eukaryotic gene(s) - in which non-preferred or less preferred codon(s) are replaced to provide high level expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                δ
밁
                                    of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                 New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens pests, for conferring increased resistance to plant disease, or for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance;
                                                                                                                                                                                                                                               The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp seqdata uspto gov/sequence.html?DocID:2004034888. The polynucleotide

                                                                                                                                                                                                                                                                                                                                                       plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert polynucleotide that can be used in the recombinant DNA construct of the

                        plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This sequence represents a plant full length insert
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; recombinant DNA construct; physical array; plant breeding marker; recombinant construct; drought tolerance; heat tolerance; beat tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; galactomannan production; lignin production; plant growth regulator;
                                                                                                                                                                                                                                                                                                                                                                                                   The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at ftp.seqdata.uspto.gov/sequence.html?DocID:2004034888. The polynucleotide of the invention are also useful in physical arrays of molecules and as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       galactomannan production; lignin production; plant growth regulator;

The specification also describes a tripeptidyl aminopeptidase (TAR) of Streptomyces. The aminopeptidase is endogenous to Streptomyces and cleaves an N-terminal sequence of X-Pro-Y, where X is an aliphatic or hydroxy amino acid and Y is an aliphatic, hydroxy or sulphur-containing amino acid. The TAP of Streptomyces useful in the production of proteins, such as GM-CSF, interleukin-3 (IL-3), IL-6, EPO, tumour necrosis factor (TNP) SCF, IL-7 and IL-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptomyces tri:peptidyl aminopeptidase pro-peptide from secreted proteins.

The polypeptide is a protease, and was used to identify inhibitors, which were then used in the method of the invention. The specification describes a method for producing a heterologous protein. The method involves incubating a Streptomyces host cell transformed nucleic acid sequence encoding the heterologous protein, in the presence of a peptide-substituted chloromethylketone aminopeptidase inhibitor. The inhibitor has the structure X-proline-Y-chiromethylketone, where X is an aliphatic or hydroxy amino acid and Y is an aliphatic hydroxy or sulphur-containing amino acid. Alternately, X and Y are non-polar amino acids. Use of the inhibitor inhibits degradation of the heterologous protein by aminopeptidases. The method is useful for producing granulocyte macrophage-colony stimulating factor (GM-CSF), interleukin-3 (IL-3), IL-6, erythropoietin (EPD), stem cell factor (SCF), IL-7, and IL-2 which are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 200
